

SE Lab-1

Name	Rahul M S
SRN	PES1UG24CS359
Class	5-F

1. Requirement Table

ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall anonymize submitted manuscripts by removing author-identifying information before assigning them to reviewer pools.	High	Pass: A reviewer viewing an assigned manuscript cannot see the authors' names or identifying metadata. Fail: Any author identity is visible to the reviewer.	Ensures double-blind peer review.
FR-002	Functional	The system shall assign submitted manuscripts to reviewer pools while preventing assignments involving declared conflicts of interest.	High	Pass: A paper is never assigned to a reviewer with a recorded conflict of interest. Fail: Any conflicting reviewer receives the paper.	Prevents biased or invalid reviews.
FR-003	Functional	The system shall generate a multi-track presentation schedule that satisfies room-capacity and	High	Pass: Every scheduled session has a room with sufficient capacity and a speaker available at the assigned time. Fail:	Produces a conflict-free conference schedule.

ID	Type	Description	Priority	Acceptance Criteria	Rationale
		speaker-availability constraints.		Any capacity or availability constraint is violated.	
FR-004	Functional	The system shall allow session participants to submit questions and upvote existing questions during a live session.	High	Pass: A submitted question appears in the session Q&A queue and an upvote increases its recorded vote count. Fail: The question or vote is not recorded.	Provides the required real-time Q&A functionality.
FR-005	Functional	The system shall order the live Q&A queue according to the number of upvotes received by each question.	Medium	Pass: After a valid upvote, the question is positioned according to its updated vote count. Fail: The queue does not reflect the updated ranking.	Helps presenters prioritize questions with greater audience interest.
NFR-001	Nonfunctional	The system shall generate a valid multi-track schedule within 10 seconds after receiving the required session, room, and speaker constraints.	High	Pass: Benchmark testing shows schedule generation completes within 10 seconds for the defined test workload. Fail: Generation exceeds 10 seconds.	The problem statement explicitly requires fast schedule generation.
NFR-002	Nonfunctional	The system shall update the displayed Q&A queue within 2 seconds of a successful question	High	Pass: At least 95% of question/upvote updates appear within 2 seconds during the defined load test. Fail: The	Real-time Q&A becomes ineffective if updates are noticeably delayed.

ID	Type	Description	Priority	Acceptance Criteria	Rationale
		submission or upvote under the defined concurrent-user test load.		95% threshold is not met.
